ABSTRACT Name : F. Detiniaty Study Program : Public Health Science Title : Mother's Behavior in Infants and Young Child Feeding Stunting Age 0-23 Months (Qualitative Study in Lape Sub-district, Sumbawa Regency in 2017) Mother's behavior in Infant and Young Child Feeding (IYCF) in critical periods (ages 0-23 months) is very important to prevent stunting conditions in infants/children. This study aims to determine the behavior of mothers in feeding infant and stunting children aged 0-23 months in Lape Sub-district, Sumbawa Regency in 2017. Qualitative approach using Rapid Assessment Procedure design with data collection methods of focus group discussion, indepth interviews, and observation of mother's informants who had had and have not received IYCF counseling/education. Knowledge and a positive attitude towards mother IYCF related information obtained from counseling/education does not guarantee the implementation of feeding infants and children properly. The existence of family support factors, unsupported tradition, access and utilization of foods and the practice of providing information through counseling to be one that inhibits IYCF activities. Mother's behavior in feeding infant and stunting children 0-23 months in Lape Sub-District is not optimal. It is necessary to evaluate the implementation of IYCF counseling activities in the field. Keywords: stunting, maternal behavior, infant and young child feeding (IYCF)
